OllyGarden

ollygarden.com

You don’t have too much telemetry.

You have bad telemetry.

The answer to observability cost isn’t sampling and dropping. It’s understanding what you’re collecting and why. OllyGarden analyzes your telemetry to find the bad telemetry at its source: the noisy health checks, the leaked PII, the missing attributes. Issues that quietly waste budget and increase risk. Solve the problem at the source Fix the problem instead of hiding it.

Why Quality Beats Quantity

1 Find the Bad Telemetry

- Noisy endpoints: health checks, debug logs, and static assets consuming budget
- Leaked secrets: PII, passwords, tokens, and tax IDs hiding in spans and logs
- Missing context: attributes that would make debugging possible
- Organizations with 600+ teams report governance is ’impossible to stay on top of’ without tooling

2 Fix at the Source and Keep It Clean

- Remediation guidance tied to specific code and services
- Automated checks in PRs prevent bad telemetry from creeping back in
- Good telemetry is essential for both humans and AI agents to understand what’s happening
- 20% instrumentation score improvement within 3 months

3 Reduce Costs and Risk Together

- Eliminate waste without losing coverage
- Remove compliance risks before auditors find them
- Make data-driven decisions about what to keep
- Up to 30% reduction in telemetry waste

What Engineering Leaders Say

“Most teams don’t look at telemetry quality until there’s an incident.”

Blake Irvin
Platform Engineering Leader

“The insights you’re bringing are gold. No backend today brings this so digested.”

André Fiche
Head of Observability, Financial Services

“We’re focused on operational efficiency. OllyGarden makes a lot of sense for us.

Adriel Cardoso
Engineering Leader

How OllyGarden Works

Ingest → Analyse → Score → Fix

Insights

Analyzes production telemetry, identifies quality issues and compliance risks, provides remediation guidance

Rose

AI-powered agent that analyzes your codebase to identify and visualize instrumentation issues, and automatically proposes fixes on demand, helping teams consistently improve telemetry quality before issues reach production.

Tulip

Our supported OpenTelemetry Collector distribution for enterprises that need reliability and predictability when operating collectors in production, reducing operational risk while maintaining full visibility across environments.

Why OllyGarden

Telemetry Quality Intelligence

Pipeline tools route and drop data. Observability backends store and query it. OllyGarden is the first platform that analyzes telemetry quality at its source, finding what's wrong, explaining why, and helping you fix it before it costs you money or creates risk.

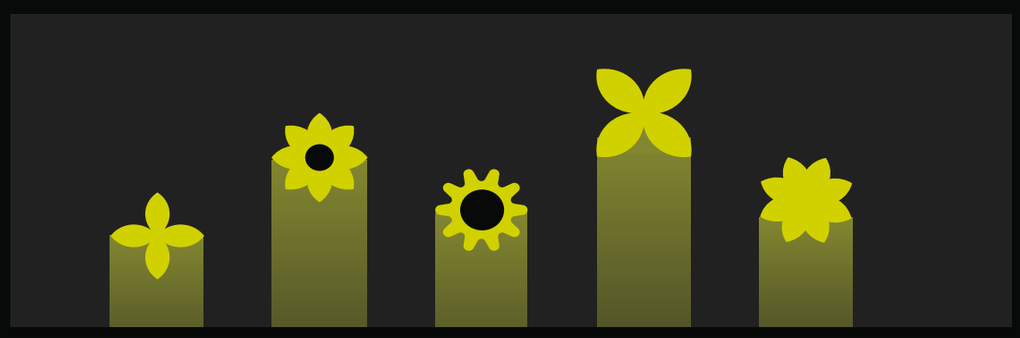

Source-first
We fix problems where they originate, not downstream in the pipeline

Actionable insights
Every finding comes with remediation guidance tied to specific code

Backend-agnostic
Works with any OpenTelemetry destination, no lock-in

Shift-left prevention
PR checks stop bad telemetry before it ships

Built by OpenTelemetry Experts

OllyGarden is founded by OpenTelemetry contributors who help shape the project. We know what good instrumentation looks like because we helped define the standards.
